1 <u>ABSTRACT OF THE DISCLOSURE</u>

2

3   A computer security system for protecting a computer from viruses and other

4 unauthorized data transmittal is disclosed. The computer is connected to a data

5 generation device, such as the Internet. The data generation device generates an

6 input signal which is received by the computer when connected to the data generation

7 device. The security system comprises a user interface which generates an output

8 signal, a networking device which receives the input signal from the data generation

9 device when connected with the data generation device, and a positive disconnect

10 device which selectively prevents operative connection between the networking device

11 and the data generation device when the output signal corresponds to a preselected

12 period of inactivity of the user interface.
